Introduction

Deep Learning

Nowadays, deep learning techniques have been applied to fields like computer vision, speech recognition, natural language processing and bioinformatics where they have been shown to produce state-of-the-art results on various tasks.

Neural Network

 Deep neural networks, convolutional deep neural networks, deep recurrent neural networks.

Structure-single layer perceptron

- Single hidden layer FF and BP
- Regression(K = 1)
- Classification(K-class)
- Linear combinations
- Activation Function $\sigma(v)$

$$\begin{split} Z_m &= \sigma(\alpha_{0m} + \alpha_m^T X), \ m = 1, \dots, M \\ T_k &= \beta_{0k} + \beta_k^T Z, \ k = 1, \dots, K \\ f_k(X) &= g_k(T), \ k = 1, \dots, K \\ \sigma(v) &= 1/(1+e^{-v}) \\ g_k(T) &= T_k \\ g_k(T) &= \frac{e^{T_k}}{\sum_{\ell=1}^K e^{T_\ell}} \quad \text{Softmax function} \end{split}$$

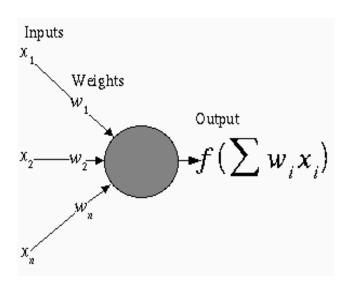

Non-linear Model

- Notice that if σ is the identity function, then the entire model collapses to a linear model in the inputs.
- Hence a neural network can be thought of as a nonlinear generalization of the linear model, both for regression and classification.
- By introducing the nonlinear transformation, it greatly enlarges the class of linear models.

Parameters

$$\{\alpha_{0m}, \alpha_m; m = 1, 2, ..., M\}$$
 $M(p+1)$ weights $\{\beta_{0k}, \beta_k; k = 1, 2, ..., K\}$ $K(M+1)$ weights

Loss functions:

$$R(\theta) = \sum_{k=1}^K \sum_{i=1}^N (y_{ik} - f_k(x_i))^2 \qquad \qquad R(\theta) = -\sum_{i=1}^N \sum_{k=1}^K y_{ik} \log f_k(x_i)$$
 Sum-of-squared errors
 Cross-entropy

Minimize by GD

Back-Propagation(BP)

1986

D.E. Rumelhart, G.E. Hinton, R.J. Williams **Learning representation by back-propagating errors.** *Nature*, 323 (1986), pp. 533–536

- Solved learning problem
- ☐ Biological system
- ...

- Hard to train (non-convex, tricks)
- Hard to do theoretical analysis
- Small training sets ...

Back-Propagation(BP)

Here is back-propagation in detail for squared error loss:

$$R(\theta) \equiv \sum_{i=1}^{N} R_{i}$$

$$Z_{m} = \sigma(\alpha_{0m} + \alpha_{m}^{T} X), m = 1, ..., M$$

$$T_{k} = \beta_{0k} + \beta_{k}^{T} Z, k = 1, ..., K$$

$$= \sum_{i=1}^{N} \sum_{k=1}^{K} (y_{ik} - f_{k}(x_{i}))^{2}$$

$$f_{k}(X) = g_{k}(T), k = 1, ..., K$$

Take derivatives:

$$\frac{\partial R_i}{\partial \beta_{km}} = -2(y_{ik} - f_k(x_i))g_k'(\beta_k^T z_i)z_{mi},$$

$$\frac{\partial R_i}{\partial \alpha_{m\ell}} = -\sum_{k=1}^K 2(y_{ik} - f_k(x_i))g_k'(\beta_k^T z_i)\beta_{km}\sigma'(\alpha_m^T x_i)x_{i\ell}.$$

Given these derivatives, a gradient descent update method:

$$\beta_{km}^{(r+1)} = \beta_{km}^{(r)} - \gamma_r \sum_{i=1}^{N} \frac{\partial R_i}{\partial \beta_{km}^{(r)}}$$
$$\alpha_{m\ell}^{(r+1)} = \alpha_{m\ell}^{(r)} - \gamma_r \sum_{i=1}^{N} \frac{\partial R_i}{\partial \alpha_{m\ell}^{(r)}}$$

Back-Propagation(BP)

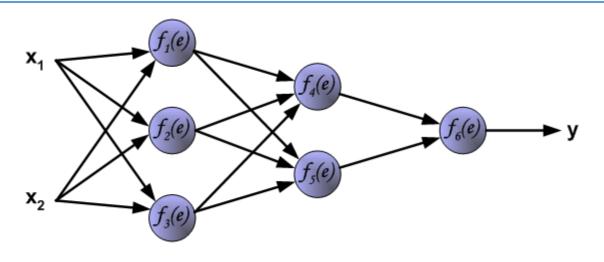

$$\frac{\partial R_i}{\partial \beta_{km}} = \delta_{ki} z_{mi}$$

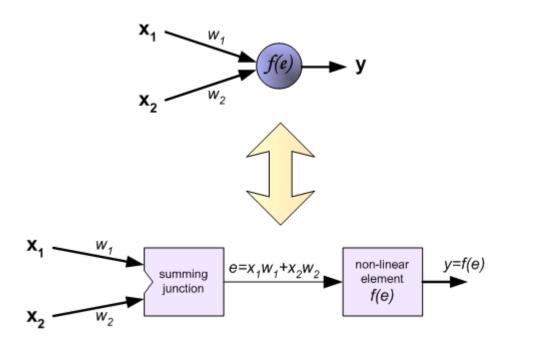

$$\frac{\partial R_i}{\partial \alpha_{m\ell}} = s_{mi} x_{i\ell}$$
 errors and
$$s_{mi} = \sigma'(\alpha_m^T x_i) \sum_{k=1}^K \beta_{km} \delta_{ki}$$

Two-pass algorithm:

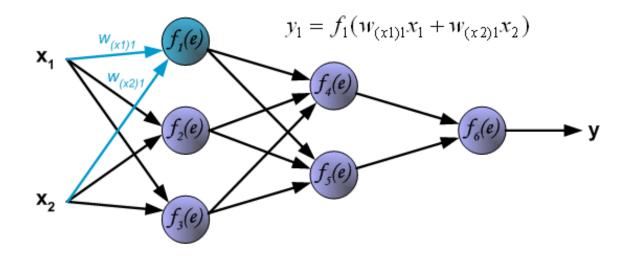

- In the forward pass, the current weights are fixed and the predicted values are computed.
- In the backward pass, the output-layer errors are computed, and then back propagated to the hidden-layer errors.

- Learning
- Tricks

Tricks-Initial values

- The weights are typically initialized to small random values chosen from a zero-mean Gaussian with a standard deviation of about 0.01.
- Note that if the weights are near zero, then the operative part of the sigmoid is roughly linear, and hence the neural network collapses into an approximately linear model.
- Use of exact zero weights leads to zero derivatives and perfect symmetry, and the algorithm never moves.
- Starting instead with large weights often leads to poor solutions.

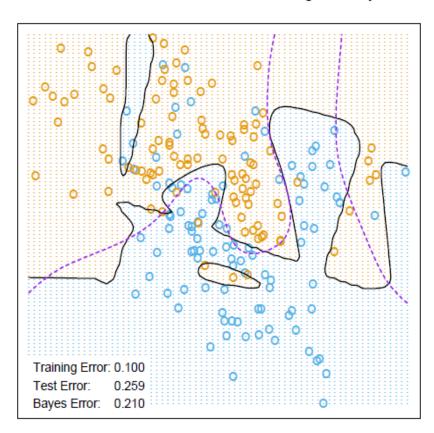

Tricks-Regularization

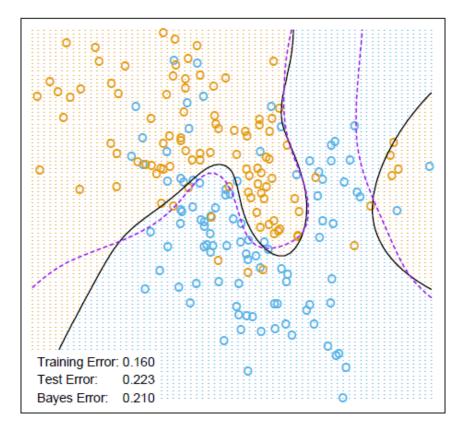

Add a penalty to the error function

$$R(\theta) + \lambda J(\theta)$$

Neural Network - 10 Units, No Weight Decay

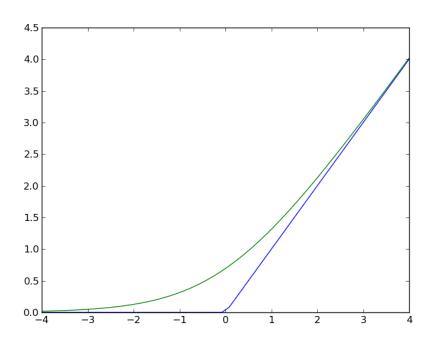

Neural Network - 10 Units, Weight Decay=0.02

Tricks-Tuning

- Learning Rate
- Mini-batch size for batch learning
- Activation function
 - Rectifier function $f(x) = \max(0, x)$

Thanks a lot!
